## What is Generative Art?

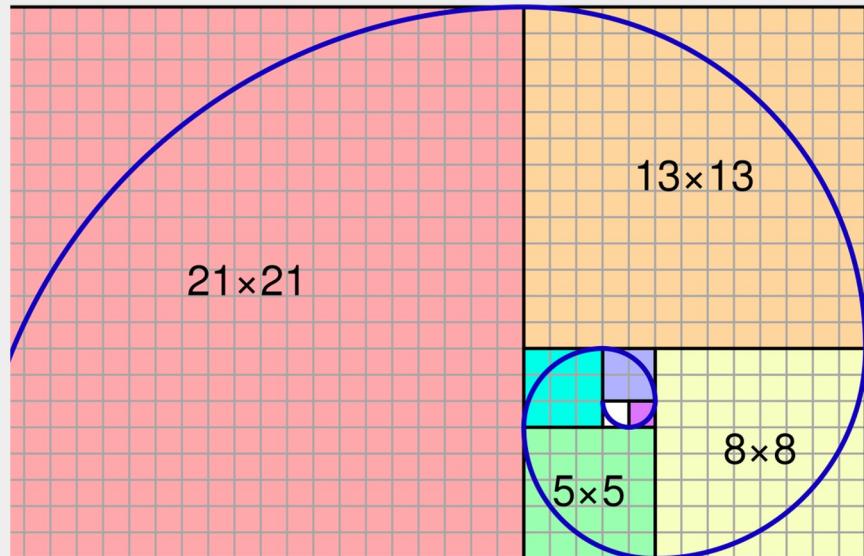

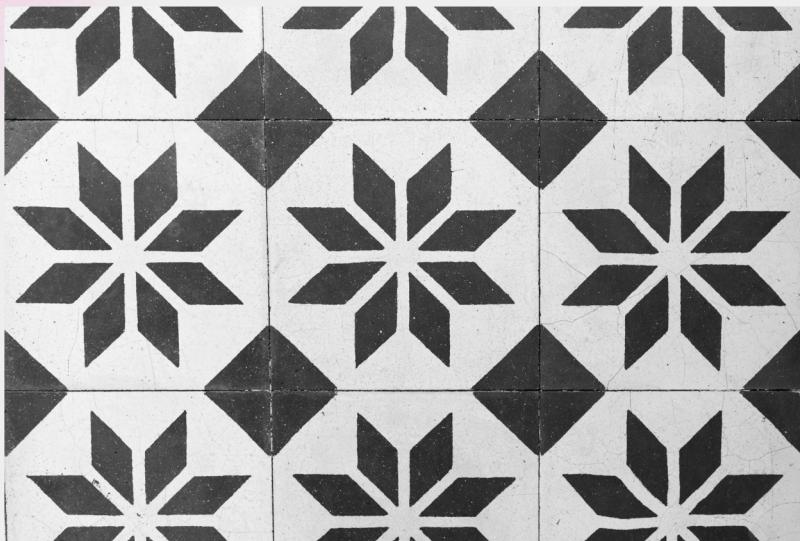

Art that in whole or in part has been created with the use of an autonomous system

---

# Attributes of generative art

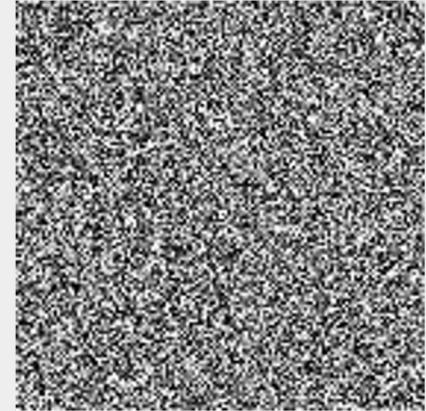

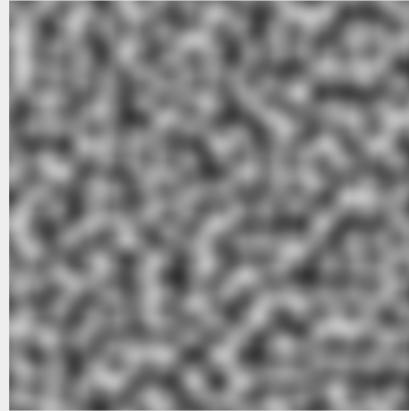

- Generated using basic rules such:
    - Games
    - Patterns
    - Mathematical functions
    - Algorithms
  - Can Introduce “Randomness”
    - Pseudorandom noise generation
    - Complex functions not interpretable by humans
-

# Rules

# Noise

- White Noise
  - Flat frequency content
  - Maximum entropy
- Perlin Noise
  - Created for Tron
  - More smooth / less random than true random noise
  - Also called Simplex Noise

---

# Examples with Generative Art

**Patterns**

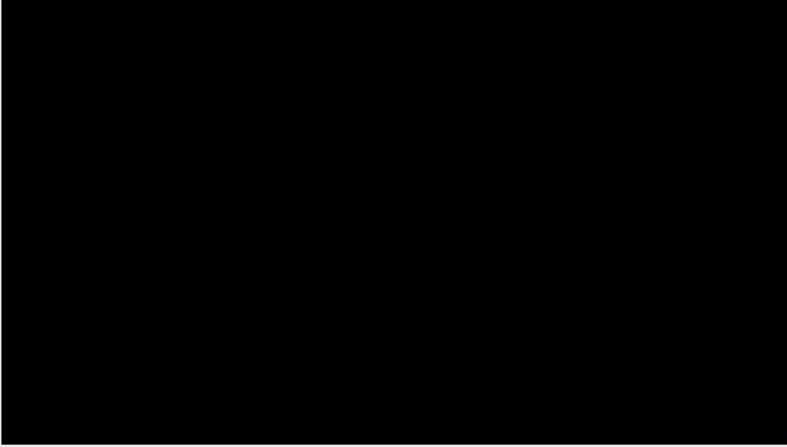

**Randomness**

**Recursion**

# Games

- Game of Life
- Musical dice games
  - Roll a dice and play a sound according to rules
- Fugues
- Brian Eno

# What is an algorithm?

- Is all music algorithmic
- What about carilloning?

The screenshot shows the gibber software interface. At the top, there's a menu bar with "gibber" and "intro" selected. To the right of the menu are several icons: a dropdown arrow, a "share" button, a "gabber" button, and a "restart engine" button. The main area is a code editor with the following pseudocode:

```
// hit alt+enter to run all code
// or run line/selection with ctrl+enter.
// ctrl+period to stop all sounds.

Theory.tuning = 'slendro'
Theory.mode = null

verb = Reverb( 'space' ).bus()
delay = Delay( '1/3' ).bus().connect( verb, .1 )

perc = FM[3]( 'perc' )
.connect( delay, .65 ).connect( verb, .35 )
.spread(.975)
.note.seq( sine( btof(8),7,0 ), 1/8, 0 )
.note.seq( sine( btof(4),3,0 ), 1/16, 1 )
.note.seq( sine( btof(8),7,7 ), 1/6, 2 )
.loudness.seq( sine(4.33,.35,.7) )

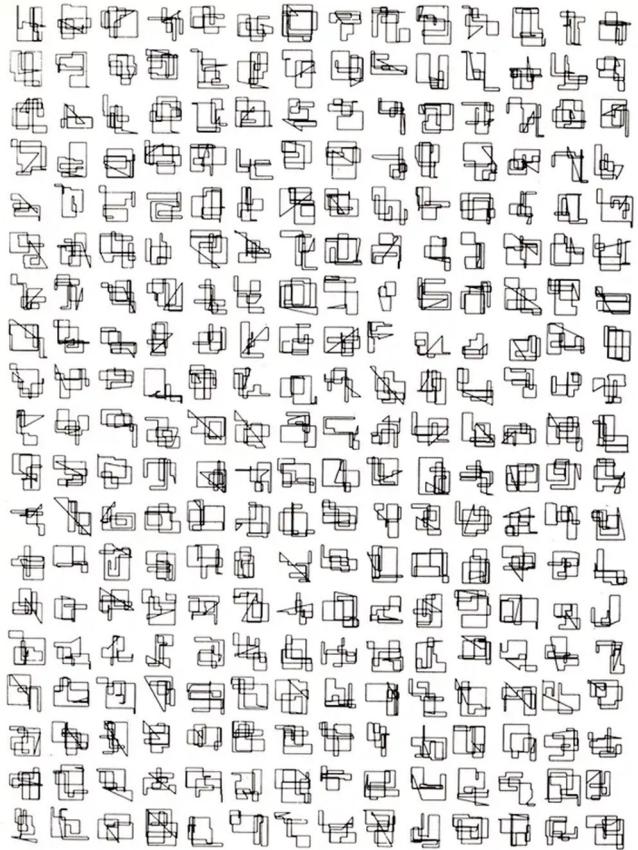

kik = Kick()
.trigger.seq( 1,1/4 )

hat = Hat({ decay:.0125 })
.trigger.seq( [1,.5], 1/4, 0, 1/8 )

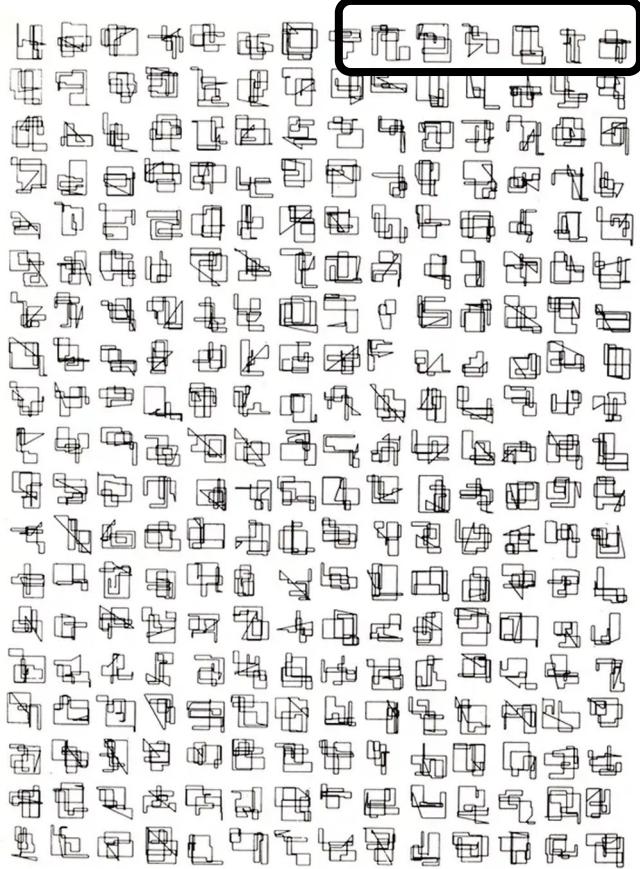

bass = Synth( 'bass.hollow' )
.note.seq( [0,1,2,-1], 1 )
.trigger.seq( [.75,.5,.25], [1/4,1/8] )
```

Painting, 1968

# Stochastic Painting Rules

1. The first pair give x and y on a canvas coordinate system for the starting point.
2. The first of the second pair, taken as a decimal of  $360^\circ$ , gives a direction from the starting point; the second, multiplied by a unit distance, say a centimeter or half an inch, measures a distance in this direction.
3. From the end of the first line the first number of the next pair measures a distance; the second, multiplied by  $15^\circ$ , measures an angle turned counter-clockwise from the tip of the previous line.
4. Successive lines are developed by successive number pairs from the ends of the previous lines or from the outer sides of closed areas.
5. We now must have a rule for closing the areas. I first tried a rule that produces areas that are all triangles or polygons with no internal angles greater than  $180^\circ$ . I chose to join the figure at the end of a line when any projection of a line was pointed towards the originating side of the polygon. This leads frequently to several lines radiating from a point, which gives some sense of three-dimensionality to the final painting.
6. At the edges of the canvas I first adopted the simple rule of extending the line by equal-angle reflection.
7. When the canvas is completely covered, the choice of colors can be made by successively numbering each closed area by a number taken in sequence from a random-number table. The nature of the painting can be quite affected by ruling that contiguous areas may or may not receive the same color. I chose to eliminate contiguous areas of the same color thereby ending up with colored areas all of polygonal character.
8. If the tubes of paint are numbered successively, in any order, ten random numbers distribute the ten colors among the numbers from 0-9.
9. The remainder of the operation, as in any number painting, permits the painter to choose textures and shades at will. Or, if he wishes, he can mix a certain amount of white with the paint for each area

# Modern Generative Art

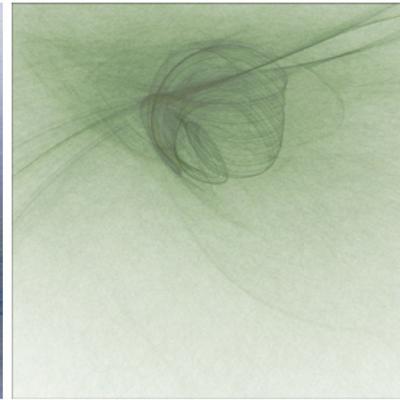

# Generative Artworks

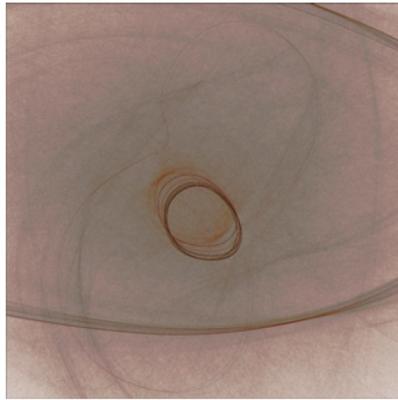

Robert Hodgin,  
2010

All 3 pieces created by the same  
algorithm

Matt Pearson,  
2010

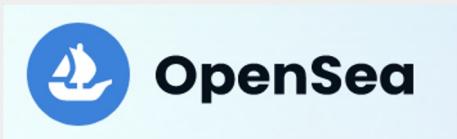

---

Generative art is a form of algorithmic art where a computer program generates the artwork based on a set of rules or parameters. It often involves complex mathematical processes and can produce unique results each time it is run.

# Blockchain and Generative Art

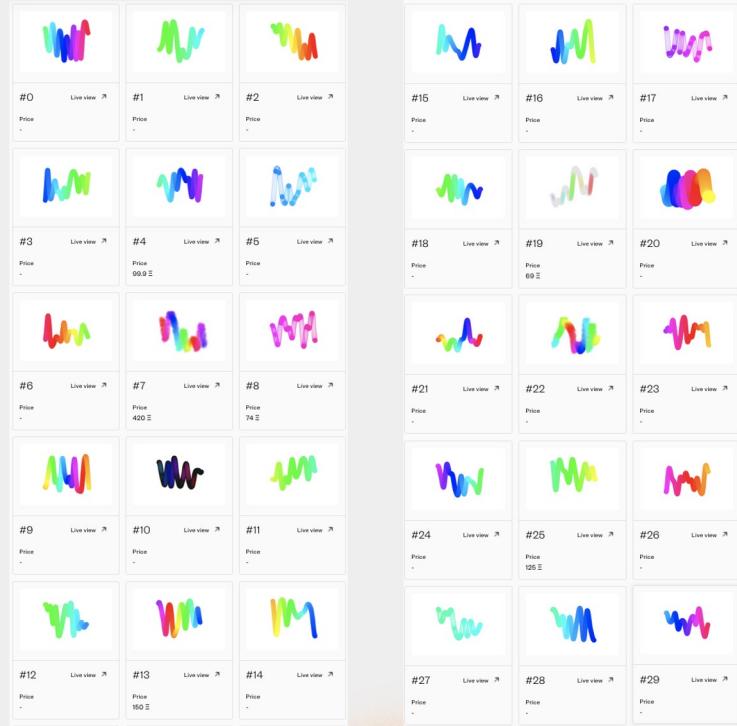

- Used to provide proof of ownership of many types of art
  - Art not stored on chain
- Generative art applications
  - Code stored on chain
  - Takes a hash input that decides the unique output

NFT exchange founded in 2017

# Processing

```
from p5 import *

def setup():
    size(100, 100)

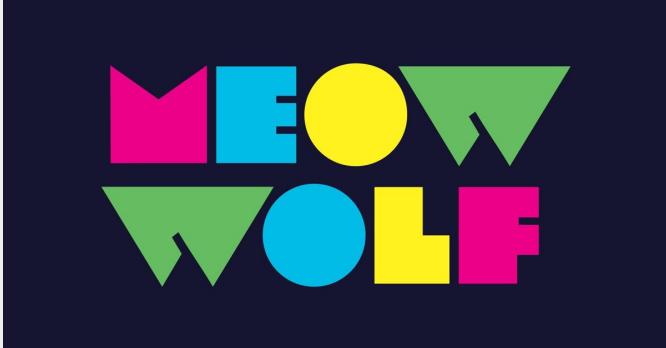

def draw():
    text_size(64)
    fill(0, 140)
    text("8", (0, 60))
    text("8", (15, 65))
    text("8", (30, 70))
    text("8", (45, 75))
    text("8", (60, 80))

if __name__ == '__main__':
    run()
```

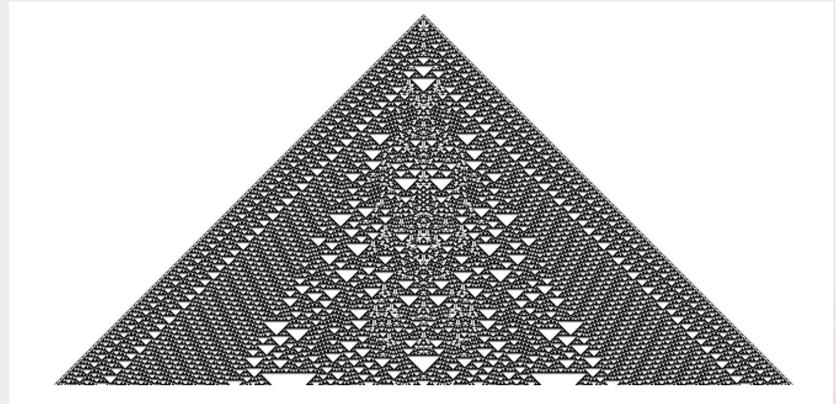

# Cybernetic art

- Any kind of feedback-driven art
- Crowdsourced data
- Interactive art exhibits

# Cellular Automata

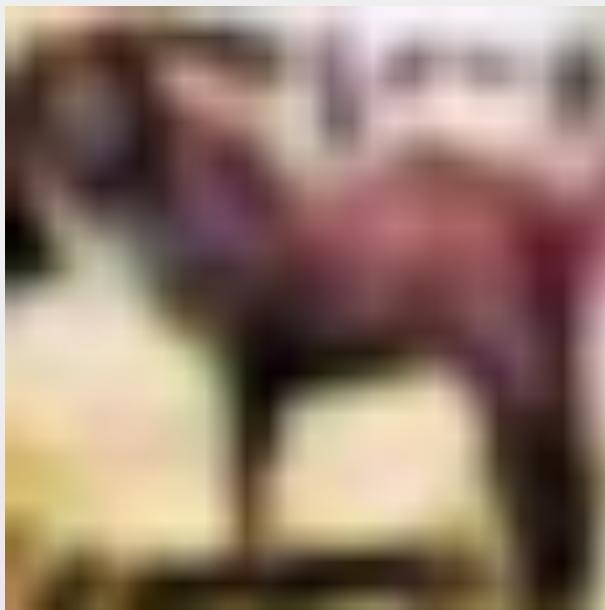

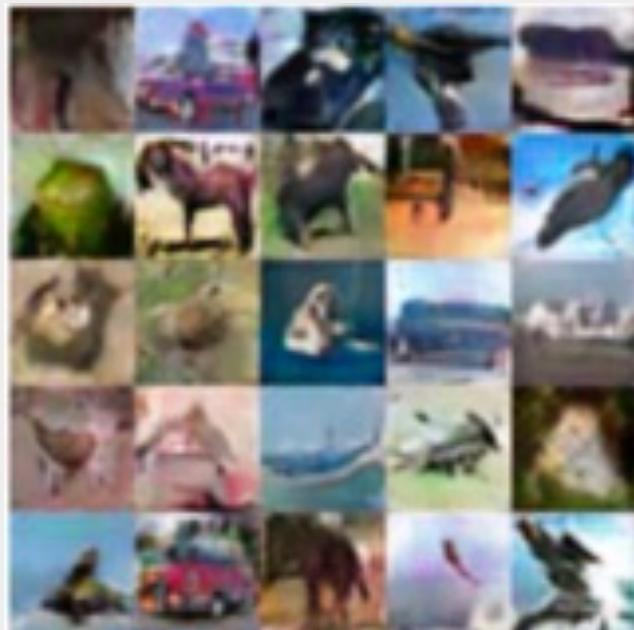

- <https://math.hws.edu/eck/js/edge-of-chaos/CA.html>
- Uses a set of rules to decide the next state
- On the edge of stability and chaos
- Can create complex patterns or simple repetitions
- 88 unique elementary cellular automata
  - Binary, 1D, based on the state of a cell and its nearest neighbors
- Asynchronous vs synchronous updating
- Stochastic (random) cellular automata or locally interacting Markov chains
